

RECIRCULATING WATER DE-DENTER

The Challenger Drumtech Recirculating Water De-Denter is simple to operate and will reshape badly damaged drums under hydraulic pressure. It allows all round accessibility to enable creases to be beaten out using leather mallets and it will process drums that will not generally seal on air type machines.

The machine comes complete with both a water tank and a recirculating pump to both fill and empty the container. A compressed air powered hydraulic cylinder provides clamping and the simple operation is controlled by a hand lever control.

This machine can be adapted to process many different types and sizes of container.

Technical Information

Production rate	30 drums per hour
Electrical supply	400/3/50 VAC
Environmental protection	IP55
Power requirement	7.5 kW
Compressed air pressure	6 Bar
